

# Cloud-native digital trust infrastructure for business.

Enhance your online channels and IT systems with e-identities authentication, e-signing or e-sealing capabilities to provide compliant and secure online transactions for your digital business.

Conducting business digitally has become as important as never before. Companies across industries are looking for ways to leverage officially recognised e-identities, e-sign information with their customers and partners as well as provide trustworthy data using qualified electronic signatures and e-seals.

The cloud-native SigningServices API platform provides tools for enhancing company's e-channels and IT systems with e-identities authentication, e-signing and e-sealing.

SigningServices API platform simplifies integration and deployment of digital trust services for

companies and user experience for end users. Micro-services, simplified APIs and ready to use tools make integration in your IT landscape fast and reliable. Deployed in your company's infrastructure, SigningServices give you full control over authentication, e-signing or e-sealing processes and information security. No document leaves your firewalls.

## Digital customer experience

Embed SigningServices in to your online services, customer portals and applications to provide completely digital and outstanding customer service.

## Digital business processes

Enhance your software solutions and IT systems with with SigningServices to add value and boost efficiency in your business

### Easy integration and deployment

Cloud-native, developer friendly, documentation and support

### Great e-signing user experience

E-signing is simplified for users to just a few clicks and PIN entry or scratch on a touch-screen

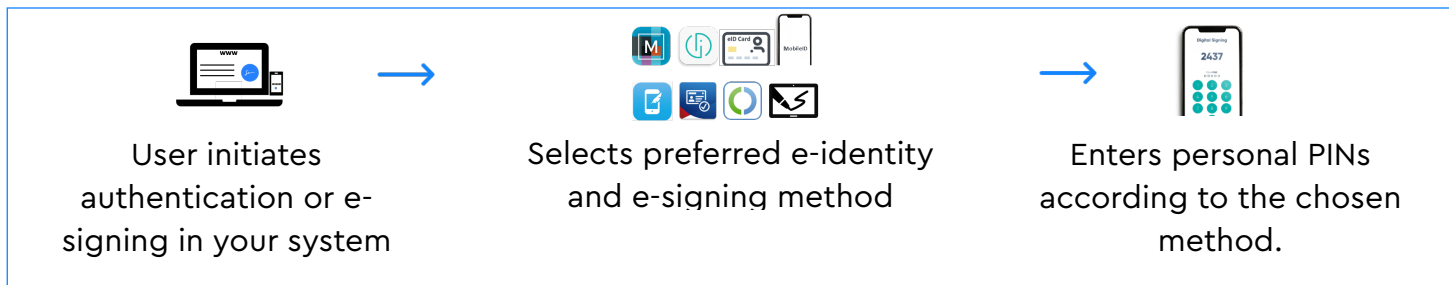

### Security and full control

Solution is deployed in customers infrastructure and no document leaves the firewalls

## How it works

Once SigningServices is added to your online channel or business system, authentication or e-signing is available right there easily and totally secured.

User authentication, e-document generation, validation, e-signing, e-sealing, time-stamping, archiving and other related tasks are handled by SigningServices.

## For companies

Signing Services enable your IT teams to enhance your online channels and business systems with digital trust services capabilities for compliant, secure and user friendly digital transactions with your customers and employees. SigningServices API platform, Authentication Service or Portal, PadSign, E-Sealing Service, SignBox solution for business users to manage e-signing processes, standard integrations and add-ons for information management systems by Microsoft, Optimal Systems, OpenText, DocuWare and others are available to facilitate your digital business.

### Micro-services architecture

Leveraging Java and Spring Boot framework technologies, SigningServices can be run on any JAVA runtime environments with best practices from CI / CD.

### Ready-to-use components

Portal samples for user interface, multiple supported archives for information storing and managing, sample postman projects and other tools to meet your company's needs and deliver seamlessly.

## For IT solutions providers and product owners

Enhance your document management, CRM, ERP, HRM, E-commerce or other platforms with digital trust services to add value to your customers, reach new markets and grow your business. We'll take care of the digital trust services capabilities for you.

## Digital trust services simplified.
